

Mononucleosiand Returnto Participatio in Sports Policy

Purpose

ThispolicyoffersguidanceegardingsafeandtimelyreturntoplayfollowinganillnessofInfectiouls/Iononucleos(\$1/M or ^ u } v Jhepolicyis intended to ensure the safety of student/athletes povideguidance to healthcare providers at Health Services and offerabette understanding of IM to those who are involved with studentathletes. The policy is based on the natural history of IM, currents cientifiliteraturand consensus tatements.

Background

The primary factors overning eturn to-play decisions are: The presence fan enlarged spleen (iesplenomegaly) is known of complications and the resolution of a cutil liness Splenomegaly cours to some degree in about 50% of IM cases (Burrough 2000). The risk of splenia up tures increased when splenomegaly present Though splenia up tures uncommor (occurring 0.1-0.5% of all cases (Putukia, 2008)) carries otentially erious complications cluding if etherate ningleeding. When splenia up ture does occur it is mainly seen prior to the 3rd week of illness although thas been reported up to 7 weeks (Putukian 2008). Rup ture can be spontaneous rassociated with modest rauma Any activity prior to 3 weeks of illness carries an increase disk of splenia up ture In ultra sound tudies peak spleens ize is within 2 weeks of illness and the majority esolved by 4-6
